Description

Larvae food supplement / Breeding material

100% organic, made from White rot wood logs (Oak),

To be used in conjunction with our [larvae substrate](#).

Larvae food ideal for raising species which like a high amount of white rot wood in their diet such as: Dynastidae, Golofa, Megasoma, Xylotrupes, Chalcosoma as well as most Lucanidae species which can be raised using this substrate. This substrate is added when necessary to our [Larvae substrate](#) (add around 10% when topping up your larvae substrate after removing old faecal pellets using a plastic colander).

We suggest adding this to your adults breeding container as it will increase the chance your female will lay a good amount of eggs.
