Description

One dry block - 23cm length, 11cm width, 8cm height. To be soaked before use.

Enough material for two pupation chambers.

Use:

When larva reach their full size and metamorphosise into adults they need a chamber. In the wild they build this material themselves inside the rotting wood.

In captivity our substrate is ideal for growth but is too soft for chamber material. Some breeders create the chamber from impacted clay soil under the substrate but we recommend the solution used by most far east breeders where a hollowed out chamber of inert Oasis wet foam brick is used.
